

# Your cloud passed the review in March.

## It is not March any more.

CyberMon checks your cloud continuously against the frameworks you are assessed against, keeps the evidence attached to every finding, and returns prioritised, step-by-step remediation guidance.

### MOST CLOUD PROBLEMS ARE NOT ATTACKS

A storage bucket opened for a migration, never closed.

A role granted broad permissions during an incident, never revoked.

A control that passed the last review, quietly failed in June.

Three weeks assembling screenshots before every audit.

**None of it raises an alert. The expensive part is rarely the fixing — it is proving what the configuration was, and when.**

### ONE MISCONFIGURATION, FOUR CONTROL OBLIGATIONS

#### One finding

A storage bucket holding customer records is readable without authentication. Detected on an ongoing check, not at audit time.

#### SOC 2

logical access controls

#### ISO 27001

Annex A access control

#### GDPR

security of processing

#### PCI DSS

stored account data

Illustrative. Control identifiers are confirmed per framework at onboarding. DPDP is not among the four mapped today.

### WHAT IS CHECKED

Cloud misconfiguration

Exposed storage

Over-permissive IAM

Privilege escalation paths

Prioritised remediation guidance

### FRAMEWORKS MAPPED

SOC 2

ISO 27001

GDPR

PCI DSS

DPDP — not yet mapped
