CYBERMON

DIGITAL RISK INTELLIGENCE

Someone may already be selling access to you.
Your logs will never show it.

CyberMon DRI monitors the leak sites, forums, paste sites and public code repositories, Telegram channels, app stores and phishing infrastructure where your data, credentials and brand are traded — and turns what it finds into an alert an analyst can act on.

NONE OF THIS TOUCHES YOUR NETWORK

Employee credentials, now in a stealer log.

A cloned app, live in a third-party store.

A one-letter-off domain, running a phishing kit.

A supplier named on a ransomware leak site.

Stolen card data, on a carding forum.

All of it happens outside your perimeter — no firewall, no endpoint agent, no SIEM will ever raise it.

A LEAKED CREDENTIAL, ON CYBERMON'S TIMELINE

DAY 0 — **Taken**
Malware on a personal laptop harvests a saved corporate login.

DAY 0–2 — **Traded**
Offered on a forum and a Telegram channel.

DETECTED — **Attributed**
Matched to your corporate email domain and raised.

ACTED ON — **Reset**
Account reset, sessions revoked, before it is used.

Illustrative. Without monitoring, **Reset** is incident response — months later.

WHERE DRI LOOKS

- Data leak sites
- Dark Web forums
- Carding forums
- Paste sites & public code repositories
- Credential leaks
- Phishing infrastructure
- App stores
- Social platforms
- Telegram channels

WHAT DRI FINDS

- Data leak monitoring
- Credential exposure
- Ransomware intelligence
- Phishing websites
- Fake apps
- Social media intelligence
- Stolen card data
- Takedowns
